cDNA was primed with a NotI-coligo(dT) primer. Five prime end enriched, double-stranded cDNA was digested with Not I and cloned into the Not I and ECO RV sites of the pCMVSPORT 6 vector. Library was constructed by Life Technologies. Contact: Feng Liang Life Technologies, a division of Invitrogen 9800 Medical Center Drive Rockville. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess Claim 1; SEQ ID No 5090; 103pp; English

The invention relates to isolated polynuclectide (I) and pulpeptide (II) sequences. (I) is useful as hybridisation probes, or polymersec chain reaction (PCR) primers, oligomets, and for chromosome and gene mapping, and in recombinant production of (II). The condition of (III). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful in medical disorders involving aberrant protein expression or biological activity. C diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodisersity and to produce other types of data and products dependent on DNA and and and agnostic coding sequences of the invention.

C Note: The sequence data for this patent did not appear in the printed of security and the action, but was obtained in electronic format directly from Wipo at ftp.wipo.int/pub/published_pct_sequences. 48888**%**8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ACAGIGGCCATCAGCAGIICCACCACIIITAGACIGICAIGCIAAIGGIGICCCCGAGCCI 420
complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides or oligoribonucleotides for antisense inhibition of gene expression usef e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. Plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps
                                                                                                                                                                                          cytokine, Id, developmental or prion genes. The method provides more frective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 TATATCACAGAIGTGCCAAATGGGTTTCATGTTAACTTGGAAAAATGCCGACGGAAGGA

DR P-PSDB; AAW80997. XX PI Human receptor tyrosine kinase protein, KDR - useful e.g. to screen PI for antagonists useful to treat diseases involving neoanglogenesis PI e.g. diabetic retinal vascularization, cancers XX	This nucleotide sequence encodes a novel receptor tyrosine kinase, contened KDR (see AARBO97), that is expressed on human endothelial colls. KDR is activated by vascular endothelial growth factor and consideres a mitogenic signal. It is implicated in clinical neoangiogenesis. KDR cDNA was isolated from a human umbilical vein conduction is call lambda phage cDNA library using a 57-6-bp DNA probe conducting product has amino acid differences from the predicted content product has amino acid differences from the previously content.	c Ala), 787 (Gly to Arg), 835 (Asn to Lys), 848 (Glu to Val) and 1347 (Cl Thr to Ser), producing a protein predicted by computer modeling to C (Thr to Ser), producing a protein predicted by computer modeling to C tay higher activity and functionality. The invention also relates CC to recombinant vectors and recombinant hosts which contain a DNA C fragment encoding human KDR, a DNA fragment encoding the C intracellular portion of KDR with or without a membrane anchor C intracellular portion of KDR with or without a membrane anchor C sequence, purified forms of associated human KDR, and human mutant C forms of KDR. KDR, fusion proteins or fragments can be used in C sesays to identify antagonists and agonists of human KDR (claimed).

ide sequence encodes a novel receptor tyrosine kinase, (see AW80997), that is expressed on human endothelial is activated by vascular endothelial growth factor and intogenic signal. It is implicated in clinical series. KDR cDNA was isolated from a human umbilical vein cell lambda phage cDNA library using a 576-bp DNA probe or generated by PCR (see also AAV99850-53). The predicted in generated by PCR (see also AAV99850-53). The predicted fuct has amino acid differences from the previously DR sequence at positions 498 (Ala to Glu), 772 (Thr to I), to Arg), 885 (Aen to Lys), 848 (Glu to Val) and 1347 producting a protein predicted by computer modeling to activity and functionality. The invention also relates introvectors and recombinant hosts which contain a DNA

Antagonists of KDP useful for treating diseases involving necangiogenesis e.g. diabetic retinal vascularization, cancers (e.g. brain, breast, etc.) and forms of inflammation e.g. rheumathits, psoriasis, contact dermatitis and hypersensitivity reactions. The polynucleotides are useful to screen for KDR
                                                                                                                                                                                                                                                                                                                 218 ICAIGAAIGIIICCCIGCAAGAIICAGGCACCIAIGCCIGCAGAGCCAGGAAIGIAIACA 277

The invention relates to a method for inhibiting expression of a target gene (ABL91688-ABL91797) in a cell by introducing at least one office that has a double-stranded structure consisting of a most 49 sequential nucleotide pairs, with at least part of one strand complementary with the target gene and has at least one end a single-stranded segment of 1-4 nt. The method provides oligoribonucleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cross present in pathogens (e.g. plasmodium or cytokine, Id, developmental or prion genes. The method provides more effective inhibition of gene expression than use of known oligonucleotides, probably because the unpaired overhang increases stability and thus intracellular concentration.
                                                                                                                                                                                                                                                               Inhibiting gene expression in cells, useful for e.g. treating tumors, by introducing double-stranded complementary oligoRNA having unpaired terminal bases.
                                                                                                                                                                                  Hadwiger
                                                                                                                                                                                                                                                                                                                                                  Claim 13; Page 67-58; 104pp; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for inhibiting expression of a target gene (AB191658-AB191797) in a cell by introducing at least one oligoribonocleotide that has a double-stranded structure consisting of at most 49 sequential nucleotide pairs, with at least part of one strand single-stranded segment of 1-4 nt. The method provides single-stranded segment of 1-4 nt. The method provides oligoribonocleotides for antisense inhibition of gene expression useful e.g. for treating tumours but the oligoribonucleotides may also be directed against genes present in pathogens (e.g. plasmodium or viruses/viroids, pathogenic on humans, animals or plants) or against cytokine, id, developmental or prion genee. The method provides more effective inhibition of gene expression than use of known
                                                                                                                                                                                                                                                                                                                                                                                                                            Human; HIV; HCV; gene expression; oligoribonucleotide; tumour; pathogen; Plasmodium; virus; viroid; cytokine; prion; antisense oligonucleotide; cytostatic; virucide; protozoacide; antibacterial; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1886 TIAAGAATGCATCCTTGCAGGACCAAGGAGACTATGTCTGCCTCAAGAAGAGGAGA 1945

binding to a receptor protein complex comprising a vascular endothelial growth factor receptor-2 (VEGFR-2) receptor protein and a neuropilin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2494
                                                                                    (NP-1) receptor protein. One method comprises introducing a sample comprising the compound to the receptor protein and allowing the compound to bind to the complex. Signaling through VEGRR-2 is enhanced in the presence of the NP-1 co-receptor. The methods of the invention can be used for identifying novel pro- and anti-angiogenic compounds. The present sequence represents the DNA encoding a human VEGRR-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TCCCCAGAGACCGCTGAAGCCTCTTGGCCGTGGTGCCTTTGGCCAAGTGA 2614
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IGACCCACATIGGCCACCATCIGAACGIGGTTAACCIGGGAGCCIGCACCAAGCAAG 1054

gene. A labelled EcoRI-BamHI DNA segment derived from clone BTIII081.8

was used as a probe to rescreen a human endothelial cound library

(#110245) for 5'full length DNA segment of the gene from which the
insert portion of BTIII081.8 is derived. A synthetic probe designed

from uniquedides 3297-3325 of BTIII081.8 is then used to isolate

more 3 full length clones. One of the clones, designated BTIII200.2

is cloned into pBluescript KS and the synthetic oligonucleotide

ICGACGCCG AIG GAG cloned, which contains the initial sequence Met
Glu. the first two amino acids encoded by the KDR gene, forming

BILVI-10, which is then purified on a Cscl density gradient. This

was sequenced, together with BIIII081.8, and BTIII129.5 to comprise

the entire ORE of 4,068 nucleotides of the KDR gene.

BTII1081.8

for

DNA encoding type III receptor tyrosine kinase - useful diagnosing the onset of cancer
